

Advanced Rendering

MATERIALS, POSTEFFECTS AND SCENE COMPOSITION

New Features

- ◆ **New Material System**
 - ◆ Allowing multi-layered PBR materials
- ◆ **PostProcessing Effects**
 - ◆ Along a simple and powerful ImageEffect API to ease the development of post effects
- ◆ **Scene Composition**
 - ◆ Allowing complex composition of multiple scene

Materials Overview

- ◆ A Material can be described by
 - ◆ **Color and (micro)Surface Attributes**
 - ◆ DiffuseMap, NormalMap, GlossinessMap, SpecularMap...etc
 - ◆ **Shading Attributes**
 - ◆ Diffuse Lambert, Specular GGX, Transparent...etc.
 - ◆ A **Composition of Attributes** by inheriting, reusing and combining basic or complex materials

Material Geometry Attributes

◆ Tessellation

- ◆ Flat or PN with support for Adjacent Edge Average

◆ Displacement

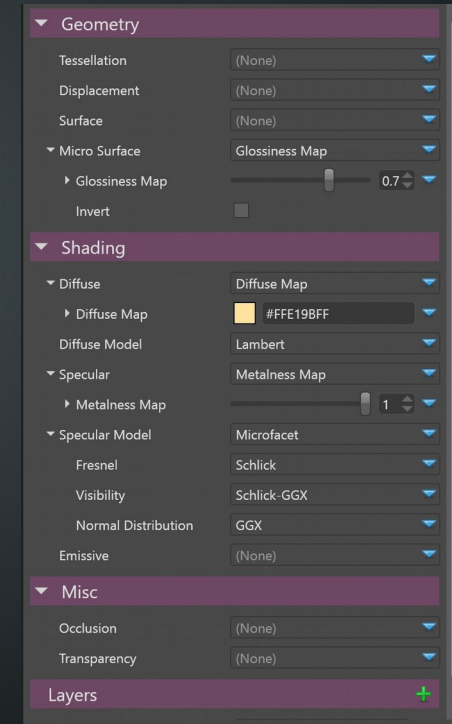

- ◆ Displacement Maps: At Vertex, Tessellation or Pixel stage

◆ Surface

- ◆ Normal Maps

◆ Micro-Surface

- ◆ Glossiness Maps

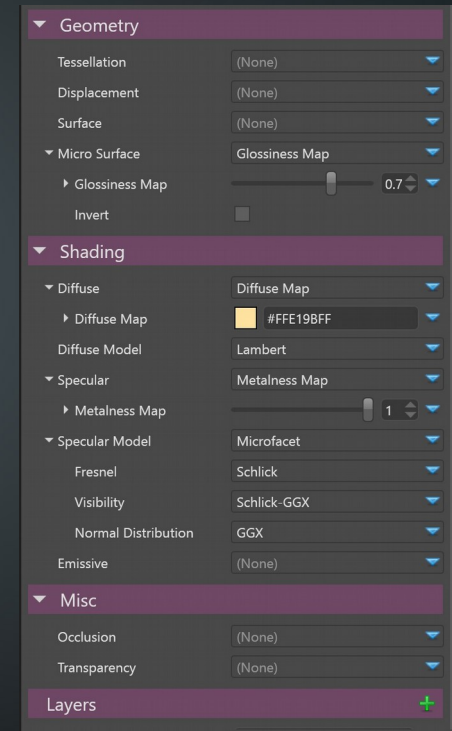

Material Shading Attributes

◆ Diffuse

- ◆ Base Color
- ◆ Shading Model (Lambert...)

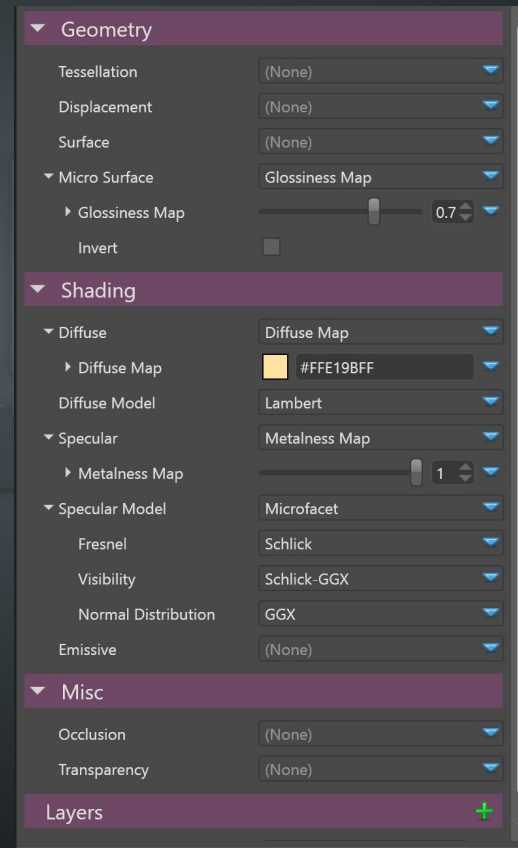

◆ Specular

- ◆ Color: **Metalness** or **Specular** workflow both at the same time
- ◆ Shading Model: Microfacet with all variations (NDF, Visibility, Fresnel) with latest GGX/Disney models...

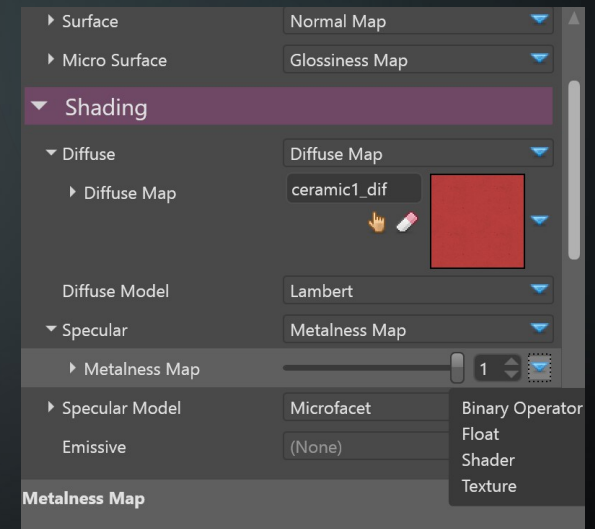

Material Shading Attributes

- ◆ **Emissive Shading models**
 - ◆ Emissive maps, Heat maps...
- ◆ **Transparency**
 - ◆ Cutoff, Additive blending...
- ◆ **Misc**
 - ◆ **Occlusion maps**
 - ◆ **Cavity maps**

Material Attributes : Value providers

- ◆ Attributes are parametrized by “value” providers:
 - ◆ A **constant** value (e.g. Metalness set to 1.0f)
 - ◆ From a **texture** (e.g. Diffuse Map)
 - ◆ From a **shader function** (e.g. Procedural maps)
 - ◆ From a **vertex attribute**
 - ◆ A **binary operator** between 2 values
- ◆ A value provider is either a **Color** or a **Float**

Material Composition: Layers

- ◆ We use a simple approach by using layers
- ◆ A Layer defines:
 - ◆ A reference to a **Material**
 - ◆ A **blending map** (e.g. float, texture...etc.)
 - ◆ Layer **overrides**: uv scale for the material...
- ◆ Layers can use different BRDF models (only working for forward/+ renderers)

Material Composition

Material Extensions

- ◆ Extensible
 - ◆ Leverage our modular shader language
 - ◆ Easily add new custom material attributes and shading models
 - ◆ Add specific blender function for a particular attribute (e.g. normal maps)
 - ◆ A material attribute can impact different stages
 - ◆ Vertex, Tessellation, Pixel
- ◆ Future
 - ◆ Allow to integrate graph node based Materials
 - ◆ Attributes squashing: combine textures at compilation time

PostEffects

- ◆ Comes with several streamlined post-effects
 - ◆ Depth Of Field
 - ◆ Bloom
 - ◆ Glares
 - ◆ Lens Flares
 - ◆ Tone Mapping
 - ◆ Anti-Aliasing, Vignetting, Film Grain...

Post-Effects API

- ◆ **Easy to use**

- ◆ `PostFx.SetInput (...)`, `PostFx.SetOutput (...)`, `PostFx.Draw ()`

- ◆ **Easy to extend** or develop new custom effects

- ◆ Add for example your own new ToneMap operator...etc.

- ◆ **Efficient**

- ◆ Easily combine many one-pass post-effects into an **optimized single shader**

- ◆ Supports both **Pixel and Compute shaders post-fx**

Scene Composition

- ◆ **Easy and powerful way to compose the rendering of your game**
- ◆ Layered based
- ◆ A **Graphics mixer** similar to an Audio Mixer
- ◆ **Render multiple Scene and combine them together**
 - ◆ From multiple cameras
 - ◆ To different outputs
 - ◆ By Filtering entities from the Scene
- ◆ **Integrated with Post-Effects**
- ◆ **Extensible**: Add your own custom renderer to the pipeline
- ◆ **Mix easily Deferred and Forward(+)** rendering in the same pipeline

Coming Next

- ◆ Add Deferred and Forward+ Rendering (previously deferred lighting)
- ◆ Physically based Camera and (area) Lights
- ◆ Real-time Global Illumination
- ◆ Screen-Space Reflection and Local Probes
- ◆ More post-effects (Motion Blur...etc.)
